

The Climate Science Alliance–South Coast is a partnership formed to create and support a network of leaders, scientists, and natural resource managers focused on sharing ecosystem–based resiliency approaches to safeguard our communities and natural resources from climate change impacts in the South Coast eco–region.

We do this through:

Science Focused Partnerships

A robust science–focused network that supports, promotes, and networks local action

Climate Smart Conservation

Strengthening regional resilience through capacity building activities and climate smart training

Innovative Community Engagement

Engaging citizens, youth, and leaders in unique and creative ways to inspire the kind of engagement and actions that will ensure future resilience
